Presentation Content

- Introduction to Forum Virtualis project
- Mintzberg's decision making model
- Disadvantages of groupware software and classical group work
- Forum Virtualis objectives
- FV system requirements
- FV system intelligence
- FV architecture skeleton following elaboration of several key features
- Discussion organization and methodology
- Discussion diagram
- An example of discussion organization in FV
- Conclusion

Forum Virtualis Project

Motivated by uninterupted function of Varazdin City Hall in the same building since 1523.

Part of Official City Hall Web site offering a new subsidiary way of local community governing.

www.varazdin.hr

Forum Virtualis Project

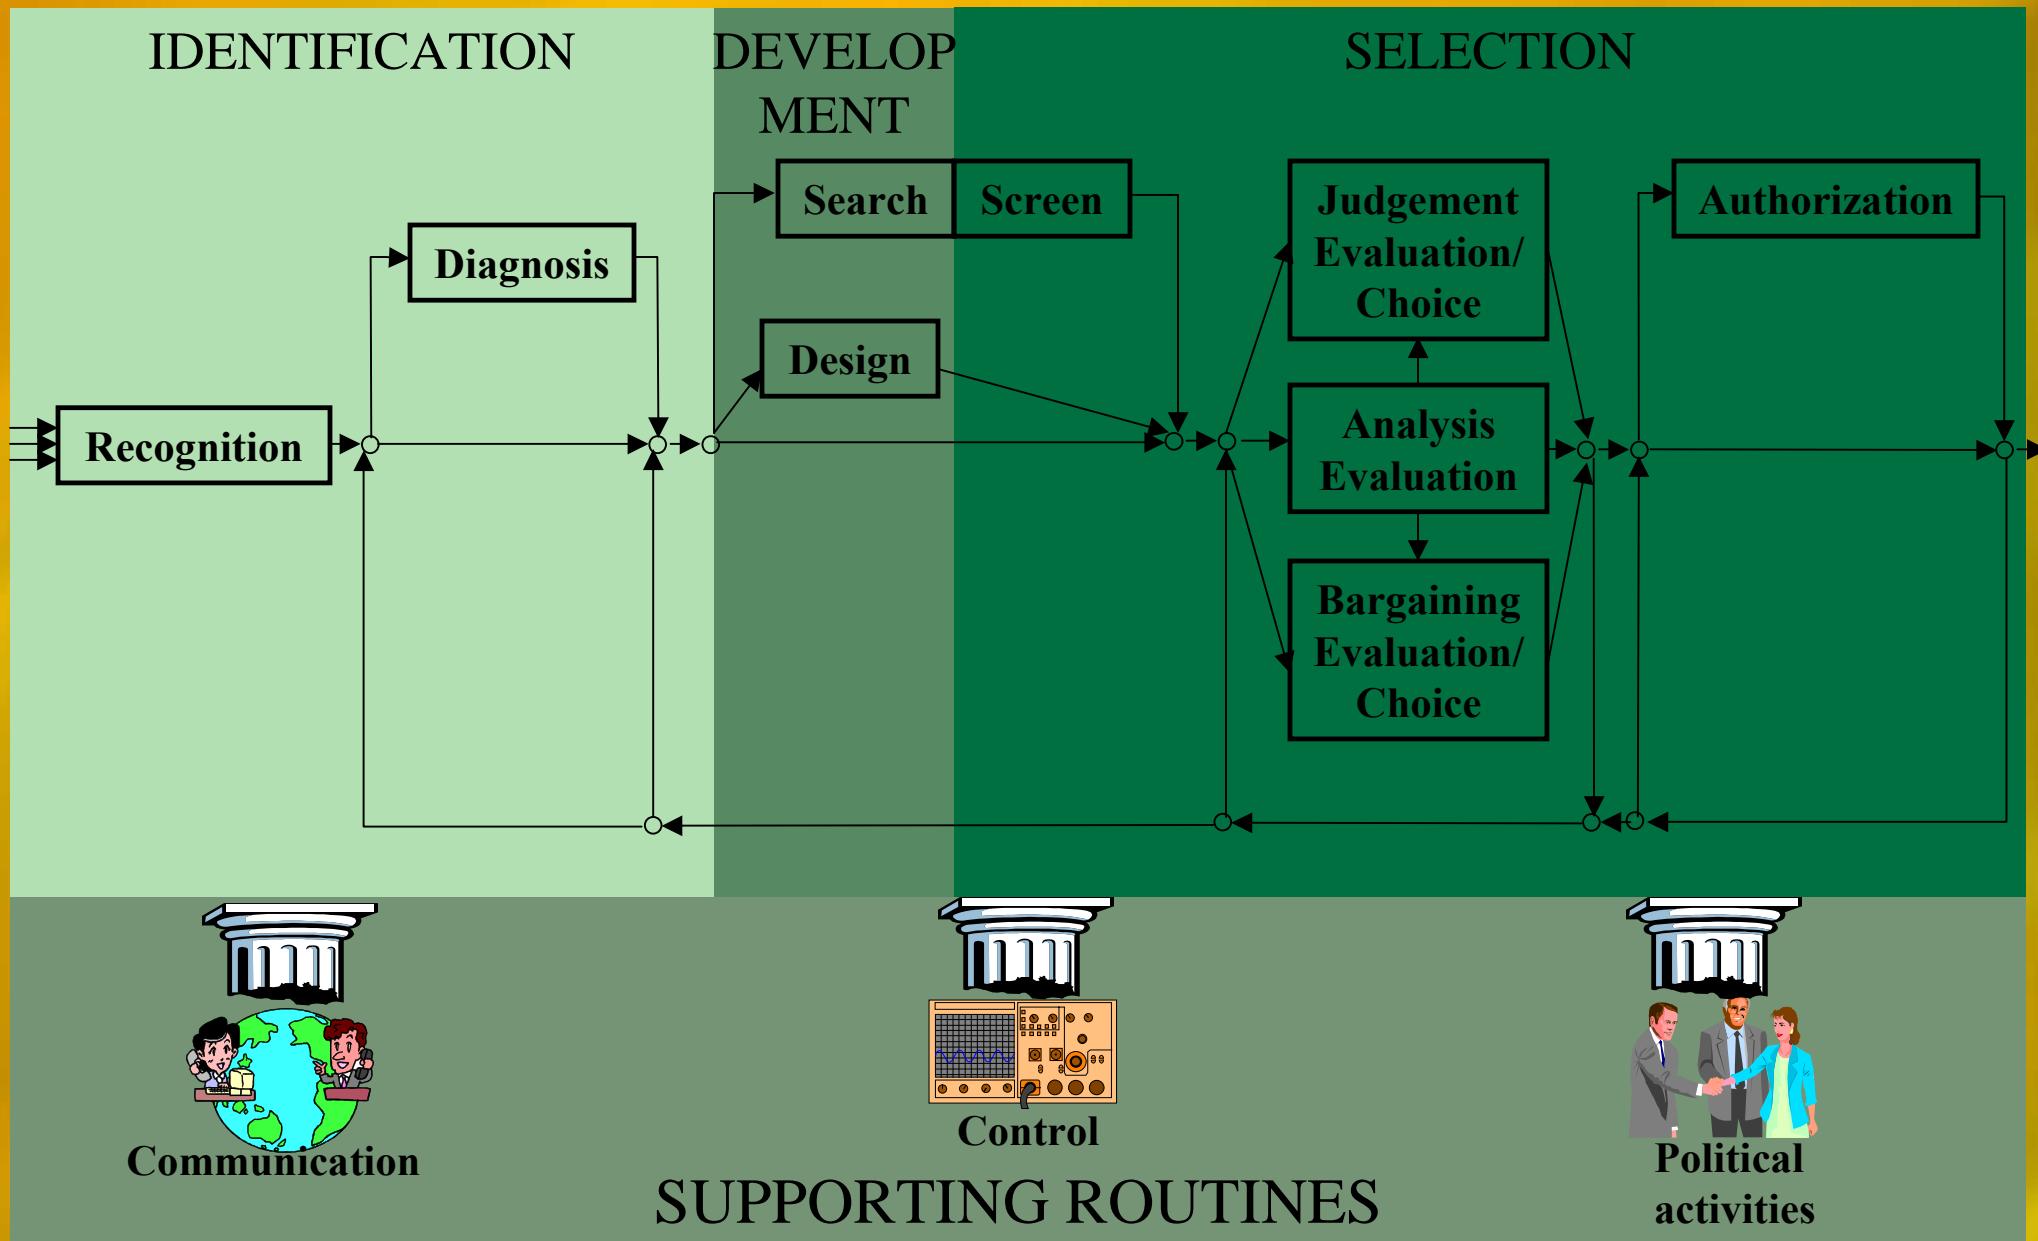

Acknowledgements

Forum Virtualis project is carried out as a student project of University of Zagreb, Faculty of Organization and Informatics, both as an educational process and inside the projects **016001 Intelligent Decision Support Systems** and **E!2586 Eurotourism Eureka – Intelligent Tourist Organization**.

Varazdin City Hall has also supported this project.

Mintzberg's decision making model

Disadvantages of Groupware Software and Classical Group Work

GDSS - Intranet and LAN-based mainly, expensive, too formal, too complex and unwieldy, no multimedia.

Video conferences - Technology based focus to the communication function.

Forums - Simple text based information exchange and idea generation, with no direct influence to process convergence and structure.

Discussion groups, chat - Information exchange without any commitment to solve the problem and apply the solution.

Disadvantages of Groupware Software and Classical Group Work

Survey - Attitudes collection only, no formal results inclusion to the decision making process.

Multiple Choice - Modelling of well-structured simple linear problems only.

Information organizer - Common well-structured information sources collection, suitable for highly formal organization only.

Parliament decision making - Old fashioned, expensive, slow, too formal, mainly disconnected from the real-time information sources and from people able to solve the problems.

Forum Virtualis Project

Forum Virtualis project is focused on obtaining an Internet technology-based system that enhance ordinal forum system with (among others) following features:

1. Structure and discipline to support all phases of decision making process,
2. Management of decision making process,
3. Inclusion of hypermedia (XML documents),
4. Upgradabilty with new tools.

Existing technologies related to the purpose of the system have been often used as examples for modeling implementations of the features.

Existing technologies or solutions will be used for implementation of some features: reports (XML documents), analysis tools, unified messaging systems.

Forum Virtualis Project

Main requirements:

- Content access and content kind
- User management
- Knowledge management
- Participation in discussion and discussion management
- Supporting FV functions
- Integration requirements

Forum Virtualis Project

FV Intelligence

Wizards

*IF There exists clear public demand for problem solution THEN
Start decision making process.*

*IF The problem becomes meningles OR The probelm becomes
irrelevant OR There are no activities in the problem solution
AND The probem is not solved THEN
Mark the problem solving process «STOPED» AND put it to
the archiv.*

*IF There exists clear demand for problem solution AND Similar
process is interrupted THEN
Get the «STOPED» process from archive AND start it.*

Forum Virtualis Project

Insight and contribution to the decision making process tasks

Model selection wizards

Model	Insight	Contribution	Example
A	Public	Public	Like ordinary forum where all citizens can see the comments and write their contribution.
B	Public	Limited	Group of experts are solving some problems while the citizens can see the process without ability of public contribution; it is exclusively reserved for experts.
C	Limited	Limited	Group of experts is solving problem without public included in the process; confidential problem.
D	Limited	Public	Delphi-like method, citizens can contribute to the process, but they cannot see it; solving the problem of corruption in the local community – citizens are discussing cases, while the group of experts are able to see the comments.

Forum Virtualis Project

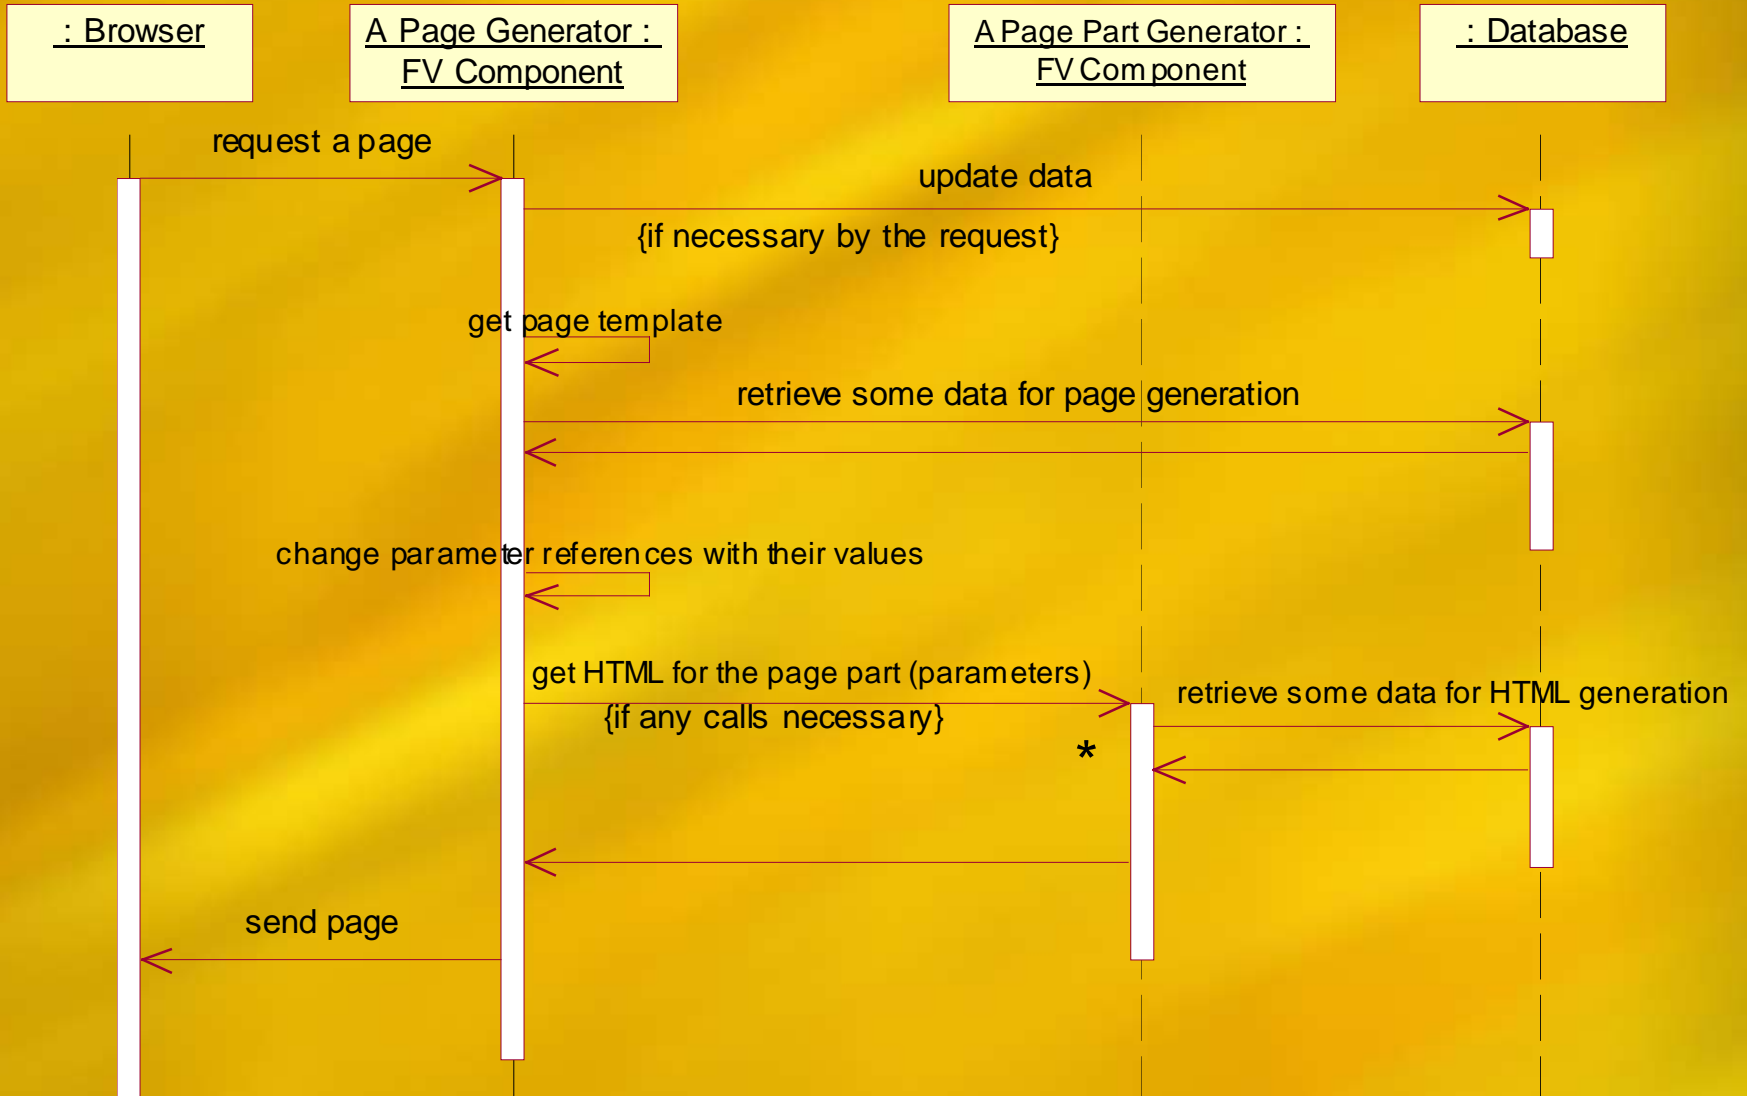

Architecture Skeleton

Forum Virtualis Project

Web page generation process (UML Sequence Diagram)

Forum Virtualis Project

Access rights

- organized around *user groups*. FV system recognizes following default user groups:

- *basic users* - registered users with basic status
- *moderators* - registered users with moderator status
- *editors* - registered users with editor status
- *administrators* - registered users which are administrators
- *registered* - all registered users
- *all* - all users, including unregistered

Forum Virtualis Project

- UI design aspect of FV

- selection of styles (cascading style sheets)
- management of all (parameterized) texts that are automatically generated by FV system

- Message broadcasting and events notification

- Open architecture for extensions of functionality of FV web site

- Help system

Forum Virtualis Project

Discussion organization and methodology

A discussion methodology for a particular kind of discussion consists of a model of discussion process and (expressed or formalized) knowledge how to use that model, where kind of discussion is like: decision process, voting, problem solving, negotiation etc.

~~Problems of supporting many discussion models:~~

- ~~• Each model has its own set of phases and rules for phase transitions and other rules.~~
- ~~• need for different data models as well~~
- ~~• a huge task for:
 - ~~• overall database scheme development~~
 - ~~• search engine applicability,~~
 - ~~• complexity of software for discussion's web page generation etc.~~~~

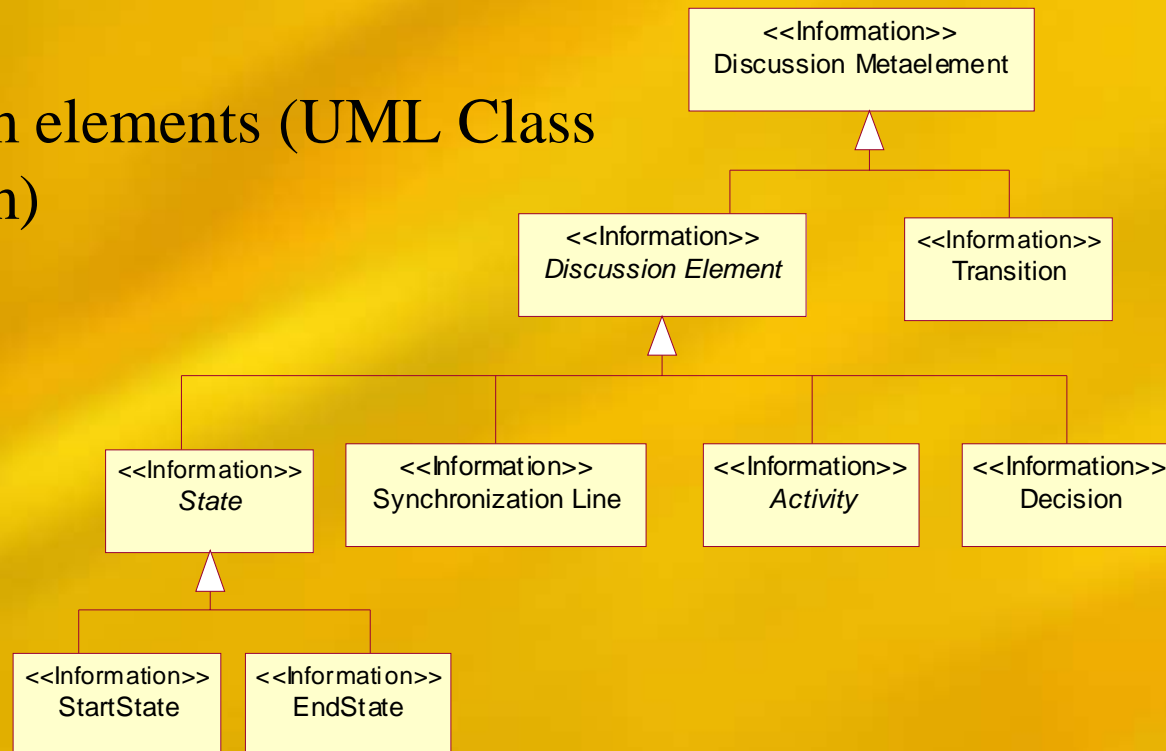

Forum Virtualis Project

Discussion Diagram

- The diagramming technique (its language – syntax and semantics) is described using Unified Modelling Language (UML).
- The diagram elements' *look* is based on UML Activity Diagram.

Forum Virtualis – threaded discussion using hypermedia documents

Conclusion

- We hope that the proposed model covers some key technologies and its functions should significantly surpass existing solutions.
- Our primary objective to obtain an open advanced experimental system is obtained.
- We also hope that it will help people to **really** solve some common problems on more efficient and natural way than with existing solutions.
- Our first area of application seems to be idealistic in the nature, but in the background, there are many more commercial applications, for example in tourism and industry.

Conclusion

- It is necessary to obtain mature solution and a group of people (*critical mass*) willing to start many processes and intrigue other people to work with them. We learned it to be *conditio sine qua non*.
- The main problem is how to initiate real serious processes with the serious participants.

Thank You!
