

John Graham has worked as a Network Engineer for the University of London Computer Centre (ULCC) since early 2000. His routine duties include operating one of the centre's core networks providing Internet connectivity to approximately fifty diverse organisations within London and the provision of technical advice and consultancy to institutions connected to the London Metropolitan Network, which connects the education and research community in London to JANET and the Internet.

He is the author of technical guides on DNS and VPNs which have been published by UKERNA[1], regularly speaks at the annual Networkshop conference in the United Kingdom and holds a Ph.D. in physical chemistry from the University of Exeter.

John is currently researching possible operational and business models that might lead to the provision of managed PKI services to the education and research community in London and would be particularly interested to hear of other delegates' experiences in this area.
