

# Improvement of Consistency among AS Policies on IRR Database

Masasi Eto, Youki Kadobayashi, Suguru Yamaguchi Graduate School of Information Science Nara Institute of Science and Technology (NAIST) Japan

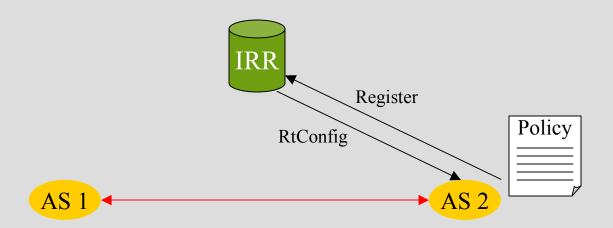

#### BGP is crucial to reliability of the Internet

- Autonomous System (AS)
- Border Gateway Protocol (BGP)
- faults in BGP disrupt large regions of the Internet e.g.
  - AS7007 (April, 1997)
  - AS3561 (April, 2001)

# Internet Routing Registry (IRR)

- Global Internet resource database storing routing policy e.g. Route Object, Aut-num Object, Maintainer Object, etc..
- Routing policies are written in "Routing Policy Specification Language (RPSL)"
- generate router configuration with "RtConfig"

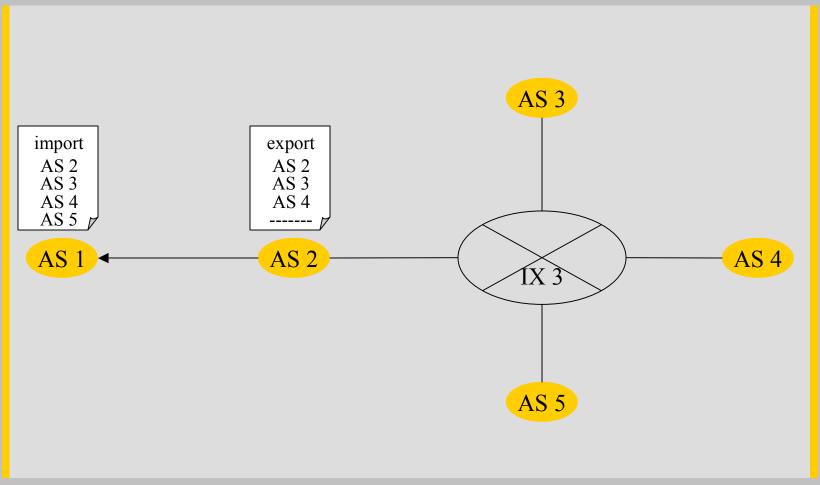

#### Problem of IRR

- Usage IRR isn't spreading due to lack of consistency.
- inconsistency we defined is
  - inconsistency between the peering contract and its RPSL description given to IRR (mistakes on interpretations)
- as a result
  - When we generate the router configurations from IRR database, the connectivity between peering ASes will be lost.
- $\rightarrow$  to find out the inconsistency systematically, we check
  - Inconsistency in routing information imported from other peers
  - Inconsistency in routing information exported to its own peers

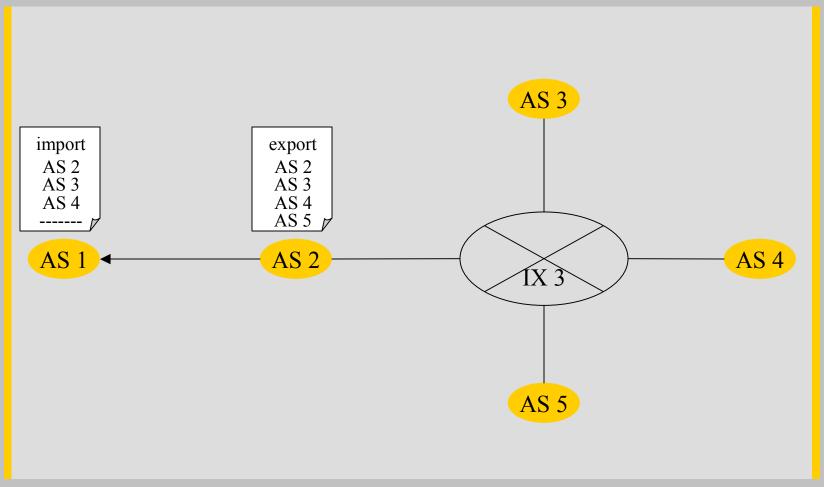

#### Inconsistency in routing information import

#### Inconsistency in routing information export

### Our Approach

- We have examined how many inconsistencies exist on whole IRR databases in the world.
- We propose a system to prevent increase of inconsistency.
  - Policy Check Server
- We evaluate this system.

## Policy Check Server

- DBGenerator
  - constructs a common database called "Unified IRR Database" which includes whole IRR databases in the world.
- Database Checker
  - inspects how many inconsistencies exist on Unified IRR database.
- Policy Checker
  - inspects whether the policy which the operator of AS is about to register is consistent with the policies of peering Ases.

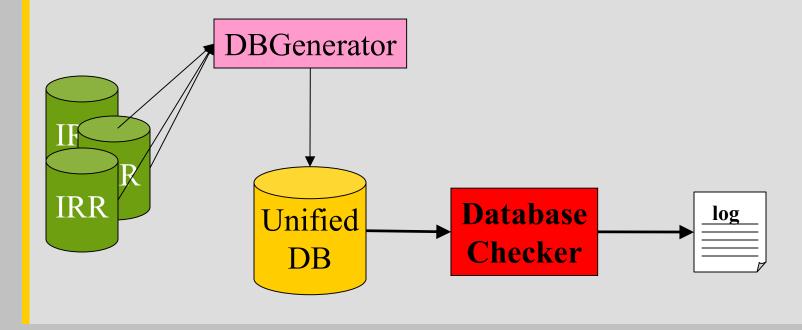

### Implementation - Environment

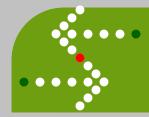

OS	Vine Linux 2.5
DBMS	PostgreSQL 7.2
Programming Language	Java
IDE	J2SDK 1.4.1
WWW Server	Apache 1.3.24
Web Application Server	Tomcat 4.1.18

#### Database Checker

- Database Checker investigates consistency of AS policies in the Unified IRR database.
- Then output the results as a log file.

# Algorithm of inspection (1)

#### 1. Specify peering AS

```
extract import, export sentences from input AS object;
if (the peering AS (or AS-SET) exists on database) {
   create Autnum object as a peering AS;
} else {
   inconsistency;
}
```

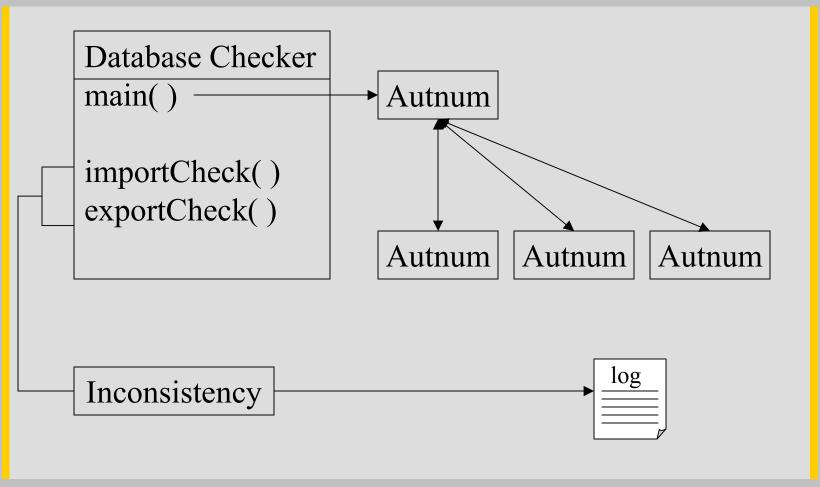

# Algorithm of inspection (2)

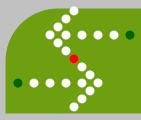

```
2. inspection of import sentence
   for (number of import sentence, repeat following processes) {
     for (number of export sentence, repeat following processes) {
        If (the export sentence specify input AS as a peer) {
           if (the sentence doesn't export required routes) {
              inconsistency;
        } else }
           inconsistency;
```

3. inspection of export sentence: same as import sentence

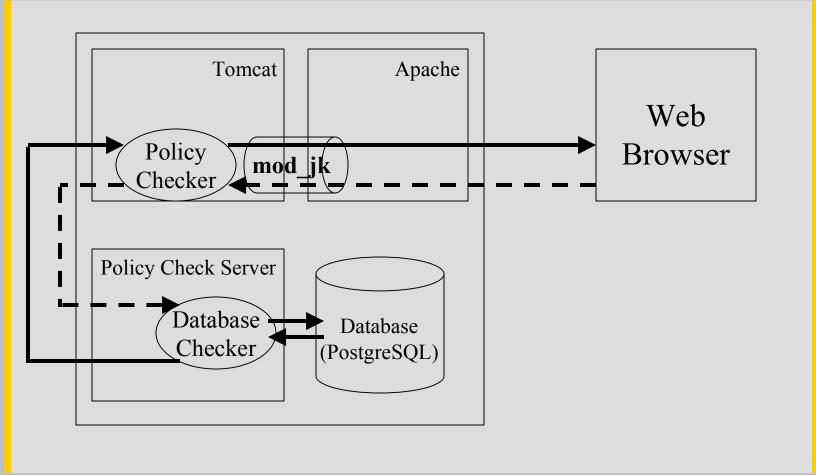

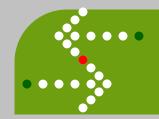

# Class Object Diagram

## Policy Checker

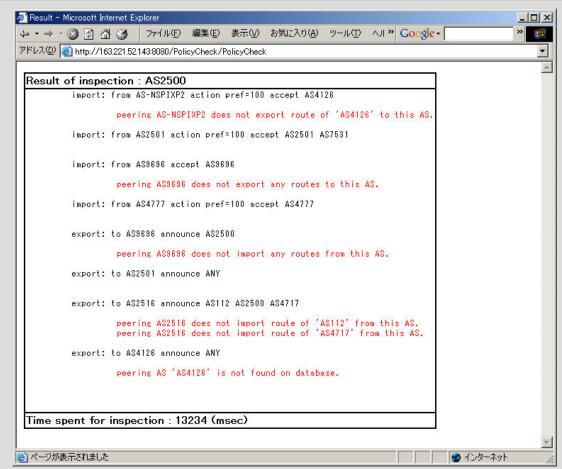

## Example – query

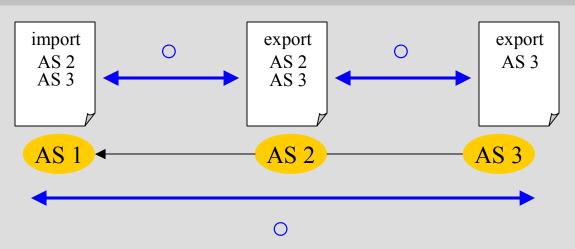

### Example – result

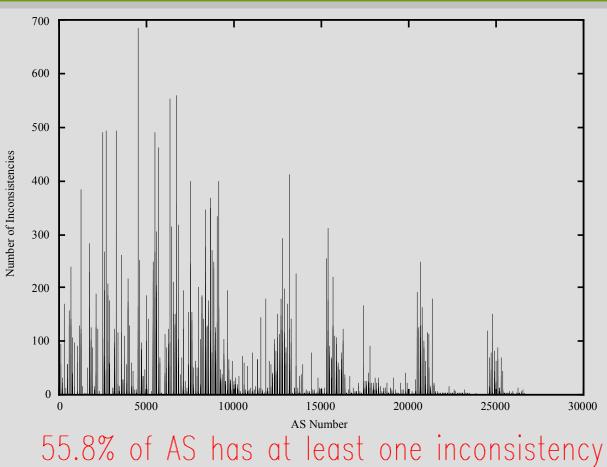

# Consistency Chain

- By correcting the inconsistencies between peering ASes, it is possible to exchange route information between ASes that are not directly peering.
  - → improve consistency of the whole IRR databases

## Analysis of inspection result

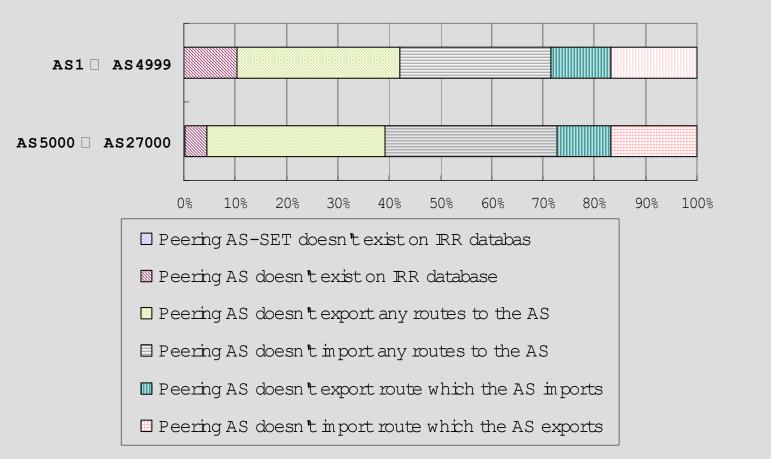

2003/6/23 IPLab NAIST, Japan

18

#### Specification of the inconsistency

#### Detail of inconsistencies

	Classification	Number	Rate
1	Peering AS-SET doesn't exist on IRR database	482	0.2 %
2	Peering AS doesn't exist on IRR database	7,971	4.0 %
3	Peering AS doesn't exist export any routes to the AS	36,333	18.6 %
4	Peering AS doesn't import any routes from the AS	34,710	17.8 %
5	Peering AS doesn't export route which the AS imports	11,436	5.8 %
6	Peering AS doesn't import route which the AS exports	17,753	9.1 %
	Total	108,685	55.8 %

• Rate of each inconsistencies in all 194,820 import and export sentences

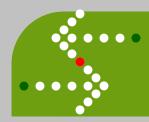

#### Operations

- JPNIC IRR (JPIRR)
  - JPNIC IRR planning team
  - Operating IRRd
  - We intend to apply Policy Check Server to JPIRR maintained by JPNIC and provide a service to inspect consistency.

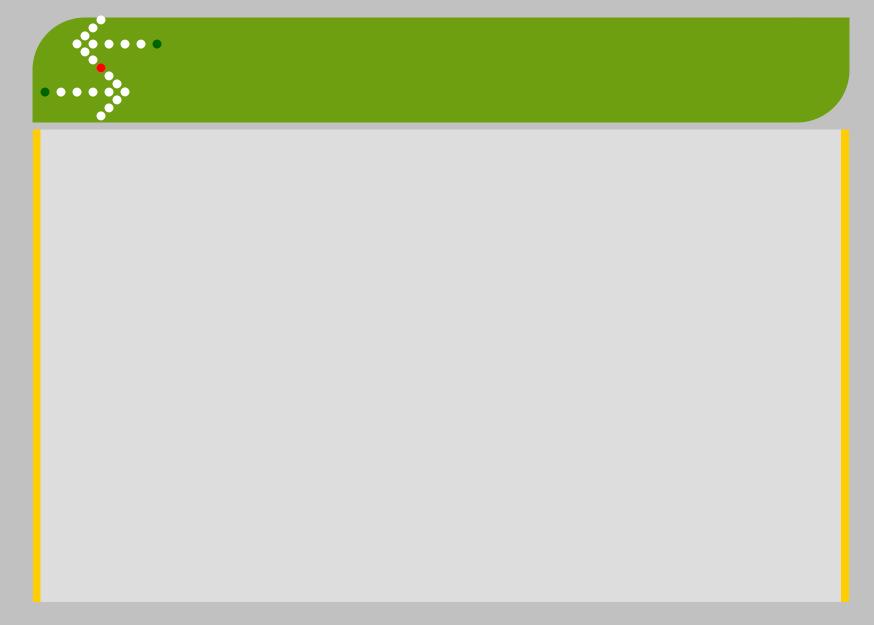

#### Conclusion

- Policy Check Server
  - Classification of the inconsistency
  - proposed a system to investigate consistency
  - proposed a system to prevent increasing inconsistency
- Analysis of inspection result
  - 55.8% of AS has at least one inconsistency
- Future work
  - Operation on IRR server

# Question?

• in slow and easy English please ..

#### Classification of Inconsistencies

Inconsistencies in	Peering AS-SET doesn't exist on IRR database
routing	Peering AS doesn't exist on IRR database
information import	Peering AS doesn't export any routes to the AS
	Peering AS doesn't export route which the AS imports
Inconsistencies in	Peering AS-SET doesn't exist on IRR database
routing	Peering AS doesn't exist on IRR database
information export	Peering AS doesn't import any routes from the AS
	Peering AS doesn't import route which the AS
	exports
