

**Evidence-based support for the design and
delivery of user-centred online public services**

Experiences of Europeans seeking health information in the cyberspace

Research Context and Methodology

➤ The Context

- eUser: "Evidence-based support for the design and delivery of user centred *online* public services"
- A study supported by the IST programme of the European Commission under FP6

➤ Policy context

- The current focus of policy makers - provision of eServices
- eEurope 2005 focus on provision of online health services (as one of the three of the core areas of European Information Society policy (i.e. eEurope 2005 Action Plan- government, health and lifelong learning).

Research Context and Research Focus

➤ The Survey (demand side analysis within the project)

- 9,807 respondents
- 10 EU old and new Member States
- Representative, multiple stratified random sampling
- Computer-assisted telephone interviews - CATI
- Fieldwork timing: Winter/Spring 2005

➤ The approach

- eHealth related interests, needs and activity patterns
- user characteristics and requirements, health service access mode, and contextual factors => users' experience
- impact - eHealth resources enabling patient empowerment (informed choice, greater patient autonomy, proactive interaction with health professionals, etc.)
- issues (for health professionals, policy makers, eHealth service providers)

Increasing prevalence of “doing” eHealth

wr

eHealth divides - overall...

Profile of eHealth users (% population) -age, gender, education, employment, income, occupation

Profile of users: eHealth - an equalising potential?

Profile of eHealth users (% Internet users)
(age, gender, education, employment, income, occupation)

Conclusions

- Across Europe, the prevalence of utilising online health resources is quite high, having increased substantially
- there is a further potential for wider use - interest of citizens / patients in using online eHealth services is apparently high
- a mixed picture with regard to user support / guidance
- a potential for empowerment and some evidence of actual empowerment
- issues for public health policy, health professionals and service providers
- a potential for “equalisation” - eHealth resources assisting policy making?
 - for those relatively more at risk in general (social exclusion perspective)
 - barriers and user support
